

Q1**Sol:**

Database schema: Database schema is a namespace used to specify the structure, relations, and constraints required for the whole database.

Database state: The data of a database at a particular instance of time is called database state.

A database state changes every time the data is added but the schema remains the same.

When an Instance is added the state changes but schema changes only when a data item is added.

The state is empty the first time DB is added to DBMS.

Example of Schema...

Schema at T=0

STUDENT

| Name | Student_number | class |
|------|----------------|-------|
|------|----------------|-------|

COURSE

| Course_name | Course_number | Credit_hours | Department |

Q2

Sol:

Entity Integrity constraints: PRIMARY KEY, UNIQUE

Referential Integrity constraints: FOREIGN KEY.

Whenever a tuple of a particular table is added/modified or when a foreign key or primary key has updated the integrity of referential constraint is violated. By default, SQL will restrict the update and avoid these violations, schema designer will specify what actions can be done and these are referential triggered actions. CASCADE, SET NULL, SET DEFAULT clauses are used whenever ON DELETE or ON UPDATE operations occur on tuples.

ex: A database stores "User Information" with "userEmail" of a user as a primary key and when a user updates their "userEmail(ON UPDATE) then the CASCADE clause is performed and all relations are updated with new "userEmail".

Q3**Sol**

1. CREATE TABLE BOOK
(
Book_id INT(5) NOT NULL
Title CHAR(10) NOT NULL
Publisher_name CHAR(5) NOT NULL
- PRIMARY KEY(Book_id)
- FOREIGN KEY (Publisher_name) REFERENCES PUBLISHER(Name)
ON UPDATE CASCADE;
)
2. CREATE TABLE BOOK_AUTHORS
(
Book_id INT(5) NOT NULL
Author_name CHAR(10) NOT NULL
- PRIMARY KEY(Author_name, Book_id)
- FOREIGN KEY(Book_id) REFERENCES BOOK(Book_id) ON DELETE
CASCADE ON UPDATE CASCADE
);
3. CREATE TABLE PUBLISHER
(
Name CHAR(5) NOT NULL
Address CHAR(10)
Phone INT(10)
- PRIMARY KEY(Name)
)
4. CREATE TABLE BOOK_COPIES
(
Book_id INT(5) NOT NULL
Branch_id VARCHAR(9) NOT NULL
No_of_copies INT(2)
- PRIMARY KEY(Book_id, Branch_id)
- FOREIGN KEY(Book_id) REFERENCES BOOK(Book_id) ON DELETE
CASCADE ON UPDATE CASCADE
- FOREIGN KEY(Branch_id) REFERENCES
LIBRARY_BRANCH(Branch_id) ON DELETE CASCADE ON UPDATE
CASCADE
);

5. CREATE TABLE BOOK_LOANS
(
Book_id INT(5) NOT NULL
Branch_id VARCHAR(9) NOT NULL
Card_no INT(15) NOT NULL
Date_out DATE NOT NULL
Due_date DATE NOT NULL
- PRIMARY KEY(Book_id, Branch_id, Card_no)
- FOREIGN KEY(Book_id) REFERENCES BOOK(Book_id) ON DELETE CASCADE ON UPDATE CASCADE
- FOREIGN KEY(Branch_id) REFERENCES LIBRARY_BRANCH(Branch_id) ON DELETE CASCADE ON UPDATE CASCADE
- FOREIGN KEY(Card_no) REFERENCES BORROWER(Card_no) ON DELETE CASCADE ON UPDATE CASCADE
)
6. CREATE TABLE LIBRARY_BRANCH
(
Branch_id VARCHAR(9) NOT NULL
Branch_name CHAR(10) UNIQUE
Address CHAR(20) NOT NULL
PRIMARY KEY(Branch_id)
)
7. CREATE TABLE BORROWER
(
Card_no INT(15) NOT NULL
Name CHAR(10) NOT NULL
Address CHAR(20) NOT NULL
Phone INT(10) NOT NULL
PRIMARY KEY(Card_no)
)

Q4**Sol:**

For Key constraint, When a tuple is added to the table the DBMS checks all the tuples of the tables and verifies if the key attribute of the tuple added is unique and only then the tuple is added. If not, the update clause is terminated.

For foreign Key constraint, If any tuple is added to the reference table the DBMS makes sure that the key(foreign) is also updated in all the referring tables with the new value.

Similarly, when a DELETE clause is implemented, the DBMS checks if, even after deleting the table's reference key, the tables referring to that tuple can be determined efficiently.

```
CREATE TABLE <Table Name>
CONSTRAINT PRIMARY KEY ()
CONSTRAINT FOREIGN KEY() REFERENCES PRIMARY
KEY()
```

Q5**Sol:**

The update command is used to change already existing attribute values to a new value. UPDATE is implemented with a combination of SET and WHERE clauses.

Ex: In a DB "PERSON" which stores user information ssn, name, city, age, and when a user changes the city we can use the UPDATE command to implement necessary changes

```
Update PERSON SET City = "Arlington" where ssn=
712838429.
```

Q6**Sol:**

| PRIMARY KEY CLAUSE | UNIQUE CLAUSE |
|--|--|
| A table can have only 1 primary key | A table can have multiple unique keys |
| Primary clause impose entity integrity | Unique clause impose data to be unique |
| Does not allow null attribute values | Can have null attribute values |
| | |

Q7**Sol**

- A. SELECT Name, Title FROM BORROWER, BOOK WHERE BOOK_LOANS.card_no=BOOK_LOANS.Book_id
- B. SELECT Author_name, Title FROM BOOK_AUTHORS, FROM BOOK WHERE BOOK_AUTHORS.Author_name = BOOK_AUTHORS.Book_id
- C. SELECT Name FROM PUBLISHER WHERE BOOK.Publisher=BOOK_AUTHORS.Author_name AND BOOK_AUTHORS.Author_name = "jk rowling"
- D. SELECT Address FROM LIBRARY_BRANCH WHERE LIBRARY_BRANCH.Branch_id=BOOK_COPIES.Branch_id AND BOOK_COPIES.Branch_id= BOOK.Book_id AND BOOK.Title = "Don Quixote".

Q8**Sol**

- A. SELECT Name FROM STUDENT WHERE STUDENT.Major = "CS".
- B. SELECT Course_name FROM COURSER,SECTION WHERE SECTION.Course_number=COURSE.Course_number AND SECTION.Instructor= "King" AND (SECTION.Year=2007 OR SECTION.Year=2008).

- C. `SELECT course_number,semester,
year,count(STUDENT.Student_number) FROM
SECTION,GRADE_REPORT WHERE SECTION.Instructor =
"King" AND SECTION.Identifier = GRADE_POINT.Identifier`
- D. `SELECT name,Grade,Course_name,Course_number,Credit_hour,
Semester,Year FROM STUDENT,GRADE_REPORT, COURSE,
SECTION WHERE STUDENT.class = 4 AND Major = CS AND
STUDENT.Student_number = GRADE_REPORT.Student_number
AND COURSE.Course_number = SECTION.Course_number AND
SECTION.Section_Identifier = GRADE_REPORT.Section_Identifier`

Q9**Sol**

- A. `INSERT Name,Student_number,Class,Major INTO STUDENT
values('Johnson',25,1,Math)`
- B. `UPDATE STUDENT SET class=2 WHERE Name='Smith'`
- C. `INSERT Course_name,Course_number,Credit_hours,Department
INTO COURSE values('Knowledge Engineering',cs4390,3,'cs')`
- D. `DELETE * FROM STUDENT WHERE Name=Smith AND
Student_number=17`
